Attachment 1: Supporting Statement

AI Engineer (hands-on), Western Environmental Pty Ltd

Kara, an agentic AI assistant. One Mount Group, Hanoi

Kara is a meeting product for web, iOS and Android. I built its agent layer: an assistant that does the work instead of describing it. Asked for a follow-up, a meeting or a CRM update, it carries it out through tools. Kara launched in July 2026 and is used by **three enterprise customers**: two banks and a real-estate group. The speech side is a separate team's service; my agent reads its output through read APIs.

I built the agent layer in Python, end to end:

- the agent service on LangGraph and FastAPI, with Redis checkpointing so a conversation can resume or roll back, and token streaming;
- the MCP tool layer and a connector service that expose **four systems** (Google Calendar, Google Drive, an internal real-estate platform, a partner bank's Salesforce CRM) as tools for retrieval and write-back, with every write behind an explicit user confirmation;
- a server-side interceptor that scopes every tool call to the signed-in user and workspace and discards identifiers the model supplies, so an injected or hallucinated id cannot reach another customer's data;
- hybrid retrieval, dense plus BM25 with rank fusion, on Qdrant;
- an evaluation harness with five metrics, a claim-level faithfulness judge and a **1,500-case** golden set that gates every model and prompt change.

Beyond Kara

- **Structured data from documents.** At BIDV I built extraction (OCR, vision language models, LLM structured outputs) across **86,000+ document sets a year at 95% extraction accuracy**. I ran requirement sessions, demos and training for its operations staff.
- **Rigid report formats.** As sole engineer on the Vietrade contract, I built a reporting engine that drafts standardised Market Briefs and Partner-Matching Notes from cross-document evidence.
- **Adoption.** I built our agentic SDLC framework on Claude Code and rolled it out to **10 engineers**. Agents now open **90% of a sprint's pull requests**.

Your domain

I built an open-source Contaminated Land MCP server with Claude Code (Attachment 2). It runs in Claude Desktop or any MCP client and gives cited search over NEPM guidance and lab screening in plain code (**13/13** hand-computed cases exact). It drafts a report's results section with client names redacted before the model sees them, then checks every citation and number against its sources: **1.0 citation validity and number fidelity** across 9 drafts, **0 PII leaks**.
